

# APRIL 2025 WEST NILE VIRUS PROGRAM

April is the official start of our season with the beginnings of larval surveillance and treatments for the 2025 season! This is when we also begin to determine areas of concern and treat areas to impede early mosquito emergence.

In April, approximately 29 sites have been treated with various larvicides to help prohibit adult mosquitoes from emerging and over 165 larvae/pupae were collected at various sites.

Surveillance for adult mosquitoes will begin in May and continue through October.

Tick surveillance also began in April with 6 tick drags conducted and 7 ticks collected and submitted for testing and identification. Ticks are active all year long, so it is always important to use personal protection!
